Services

**Auxiliary equipment**

The electrical system, including the measuring and control equipment, is an integral part of a plant, but also of individual components. The technology employed for the measuring and control equipment as well as the strategies applied for this purpose are crucial for the successful and reliable functioning of the individual plant components and of the plant as a whole. ALCUTEC therefore considers it as absolutely necessary to logically link the components of all parts of the plant at a higher-ranking level. The controls of the individual components have therefore been designed for the signal exchange at a higher-ranking level.

ALCUTEC also supplies the auxiliary equipment and accessories required to complete and complement entire plants, such as

- launders,
- crucibles and heating devices for crucibles,
- liquid metal crucibles for road shipments with a volume of between 1.5 and 10 t,
- casting stations for large pigs (ingots),
- chip drying plants,
- processing plants for aluminum salt slag.
